

Atelier 3 : Développement et Déploiement d'une API Node.js avec Consommation via React (MySQL Version)

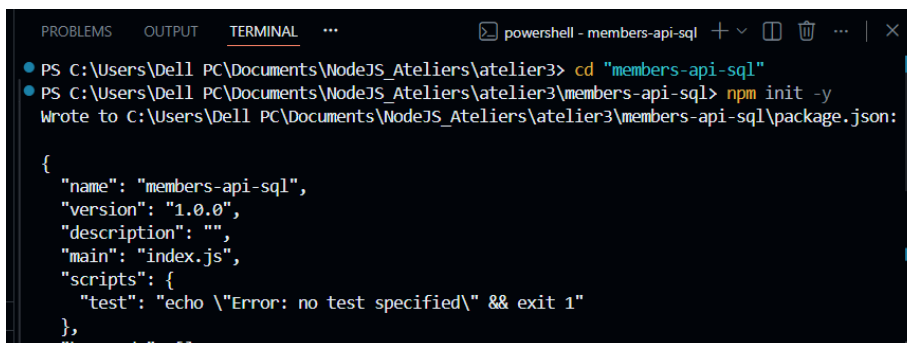

1-Introduction

Dans ce projet, nous avons développé :

- Une API REST en Node.js avec Express
- Une base de données MySQL
- Une application React JS
- Le déploiement complet sur Vercel

2-Création de l'API Node.js

Initialisation du projet :

```
PS C:\Users\Dell PC\Documents\NodeJS_Ateliers\atelier3> cd "members-api-sql"
PS C:\Users\Dell PC\Documents\NodeJS_Ateliers\atelier3\members-api-sql> npm init -y
Wrote to C:\Users\Dell PC\Documents\NodeJS_Ateliers\atelier3\members-api-sql\package.json:

{
  "name": "members-api-sql",
  "version": "1.0.0",
  "description": "",
  "main": "index.js",
  "scripts": {
    "test": "echo \"Error: no test specified\" && exit 1"
  },
  "keywords": []
}
```

Installation des dépendances

```
PS C:\Users\Dell PC\Documents\NodeJS_Ateliers\atelier3\members-api-sql> npm install express mysql morgan cors body-parser

added 83 packages, and audited 84 packages in 18s

23 packages are looking for funding
  run `npm fund` for details

found 0 vulnerabilities
PS C:\Users\Dell PC\Documents\NodeJS_Ateliers\atelier3\members-api-sql>
```

```

• PS C:\Users\De1l PC\Documents\NodeJS_Ateliers\atelier3\members-api-sql> npm install mysql2
added 11 packages, and audited 95 packages in 2s

25 packages are looking for funding
  run `npm fund` for details

found 0 vulnerabilities
• PS C:\Users\De1l PC\Documents\NodeJS_Ateliers\atelier3\members-api-sql> cd ..
• PS C:\Users\De1l PC\Documents\NodeJS_Ateliers\atelier3> cd "members-frontend-sql"
• PS C:\Users\De1l PC\Documents\NodeJS_Ateliers\atelier3\members-frontend-sql> npm run dev

```

Un test dans PostMan

3-Création de la base de données

Sur AlwaysData ou MySQL local :

```

CREATE TABLE members (
  id INT NOT NULL AUTO_INCREMENT,
  name VARCHAR(22),
  PRIMARY KEY (id)
);

```

	id	name
☐	2	Mohamed Said

4-Structure du projet API

5-Création du fichier functions.js

```
JS functions.js X App.jsx index.css main.js
members-api-sql > JS functions.js > <unknown>
1 // Success response
2 const success = (result) => {
3   return {
4     status: 'success',
5     result: result
6   }
7 }
8
9 // Error response
10 const error = (message) => {
11   return {
12     status: 'error',
13     message: message
14   }
15 }
16
17 module.exports = { success, error }
```

6-API Express prête pour Vercel

api/index.js

```
members-api-sql > api > JS index.js > db
1  const express = require("express")
2  const cors = require("cors")
3  const mysql = require("mysql2")
4  const { success, error } = require("../functions")
5
6  const app = express()
7
8  /* ===== MIDDLEWARE ===== */
9
10 app.use(express.json())
11
12 app.use(cors({
13   origin: "*",
14   methods: ["GET", "POST", "PUT", "DELETE"],
15   allowedHeaders: ["Content-Type"]
16 })))
17
18 /* ===== DATABASE POOL ===== */
19
20 const db = mysql.createPool({
21   host: process.env.DB_HOST,
22   user: process.env.DB_USER,
23   password: process.env.DB_PASSWORD,
24   database: process.env.DB_NAME,
25   waitForConnections: true,
26   connectionLimit: 10
27 })
28
29 /* ===== ROUTES ===== */
30
31 app.get("/api/v1/members", (req, res) => {
32
33   db.query("SELECT * FROM members", (err, result) => {
34     if (err) return res.json(error(err.message))
35     res.json(success(result))
36   })
37 }
```

7-Fichier vercel.json

```
members-api-sql > ▲ vercel.json > ...
1  {
2    "version": 2,
3    "builds": [{ "src": "api/index.js", "use": "@vercel/node" }],
4    "routes": [{ "src": "/(.*)", "dest": "api/index.js" }]
5  }
6  |
```

8-Déploiement de l'API sur Vercel

1-Push du projet sur GitHub

2-Aller sur Vercel

3-Import Project

4-Ajouter variables d'environnement :

DB_HOST

DB_USER

DB_PASSWORD

DB_NAME

5-Deploy

URL obtenue :

<https://atelier3api.vercel.app/api/v1/members>

```
{
  "status": "success",
  "result": [
    {
      "id": 2,
      "name": "Mohamed Said"
    }
  ]
}
```

10-Code React (App.jsx)

```
members-frontend-sql > src > App.jsx > App > handleSubmit > res
1  import { useEffect, useState } from "react"
2  import axios from "axios"
3  import "../App.css"
4
5  const API_URL = "https://atelier3api.vercel.app/api/v1/members"
6
7  function App() {
8    const [members, setMembers] = useState([])
9    const [name, setName] = useState("")
10   const [editId, setEditId] = useState(null)
11   const [errorMsg, setErrorMsg] = useState("")
12
13   /* ===== FETCH ===== */
14
15   const fetchMembers = async () => {
16     try {
17       const res = await axios.get(API_URL)
18       setMembers(res.data.result || [])
19     } catch (err) {
20       setErrorMsg("Failed to load members")
21     }
22   }
23
24   useEffect(() => {
25     fetchMembers()
26   }, [])
27
28   /* ===== CREATE / UPDATE ===== */
29
30   const handleSubmit = async () => {
31     if (!name.trim()) {
32       setErrorMsg("Name is required")
33       return
34     }
35
36     try {
37       const res = editId
```

11-Conclusion

Ce projet nous a permis de :

- Comprendre le fonctionnement d'une API REST
- Manipuler Express et MySQL
- Connecter un frontend React à un backend
- Déployer une application complète en production

Le système permet :

- ✓ Ajouter un membre
- ✓ Modifier un membre
- ✓ Supprimer un membre
- ✓ Afficher tous les membres

Le projet est entièrement fonctionnel et déployé.
